

Web-Based Environmental Mercury Mapping, Modeling and Analysis (EMMMA)

Paul Hearn Stephen Wente John Aguinaldo David Donato

Susan Price Seth Tanner Ovidio Rivero-Bartolomei

Vision: Support Scientists in Initial Phases of the Research Process

- Data collection and visualization
- Hypothesis formulation
- Scientific collaboration
- Preliminary data analysis

Produces:

- Better research designs
- More cost-effective research process

Project Objectives

1. Compile fish tissue and other mercury data
2. Describe spatial and temporal trends in national fish-Hg data set, using model to factor out the confounding effects of dissimilar samples.
3. Serve raw and interpreted fish-Hg data over the web with maps, other ancillary data, and analytical tools.

Principal Databases

- States/EPA/USGS Fish tissue – 45,605 records
- EPA National Emissions Inventory – Data for 24,000 sites
- National Atmospheric Deposition Program – Data for 83 Sites
- USGS Stream sediments and soils – 97,000 records
- USGS Coal – 28,000 records
- USGS Mines/ Ore Deposits – 190,000 records

In partnership with...

EMMMA: Environmental Mercury Mapping, Modeling, & Analysis

Visualizing the Distribution of Mercury in our Environment

[Overview](#)

Overview - What We Do

EMMMA supports mercury research and decision-making by providing tools for **Mapping, Modeling, and Analysis** of mercury data.

As with many environmental contaminants, mercury can harm the health of humans and wildlife at concentrations that cannot be detected by our senses. Scientists must use chemical analyses to detect and measure the occurrence and distribution of mercury in the water, soil, air, and biological tissues of our environment. Because of the expense of these analyses, obtaining enough information to protect the health of humans and the environment is a constant challenge. The EMMMA web site helps scientists to get the most information possible from every mercury analysis by providing tools to map and to visualize:

- How mercury concentrations change from place to place -- where concentration is high or low.
- How mercury concentrations change over time -- when concentration increases or decreases.
- How mercury is distributed in the environment -- why do concentrations in biological tissues vary and what is their relation to concentrations in water, soil, and air.

Some of the specific tools and services provided by this web site include:

Online mapping tools, USGS maps, images and other thematic data from *The National Map* to display and analyze mercury

An online model for mercury in fish-tissue, which standardizes the concentrations of mercury in fish to enable comparisons

Easy access to key environmental mercury datasets, including atmospheric mercury emissions, National

Mercury Datasets

Fish Tissue

A database of ~35,000 fish tissue mercury records was compiled by USGS from various sources, including the following:

- National Pesticide Monitoring Program (NPMP)
- National Contaminant Biomonitoring Program (NCBP)
- Biomonitoring of Environmental Status and Trends (BEST) datasets of the USFWS and USGS.
<http://www.cerc.cr.usgs.gov/data/data.htm>
- Environmental Monitoring and Analysis Program (EMAP):
<http://www.epa.gov/emap/>
- Regional EMAP (REMAP) of USEPA
<http://www.epa.gov/emap/remap/index.html>
- State agency data as compiled in USEPA's National Listing of Fish and Wildlife Advisory (NLFWA) database
<http://map1.epa.gov/>

Selected records were required to have: a non-zero mercury concentration, valid species identifier; be identified as sampled as whole fish, skin-on fillet skin-off fillet, carcass, edible, eggs, liver, viscera (samples identified as 'fillet' only were rejected); and have a length measurement that is appropriate for that species.

Please contact Steve Wentz (spwentz@usgs.gov) with corrections and appropriate additions to this dataset.

Mercury Data Mapper

The screenshot displays the Mercury Data Mapper web application. On the left, there is a toolbar with sections for "Move" (directional arrows and a hand icon), "Zoom" (magnifying glass and zoom in/out icons), "Select" (various selection tools), and "Misc" (miscellaneous utility icons). The main area is a map showing a river network with numerous yellow square markers representing data points. On the right, a "Display Legend" panel is open, titled "Mercury and Other Thematic Data". The legend includes the following items:

- All Layers
- Hg Point Emissions Data
 - Major Hg Emissions (.01 + TPY)
 - All Hg Point Emissions (TPY)
- Fish Tissue Hg Data
 - Fish Tissue Raw Data
 - Modeled Data (By Species)
 - Common Carp
 - Largemouth Bass
 - Walleye
- Soils & Stream Sediment Data
 - Soils Hg (ppm)
 - Sediment Hg
- Mine Locations
 - Hg Mines
 - All Mines
- Coal Data
 - Mercury Concentration (from C

At the bottom left of the map, there is a "Zoom In" button. A scale bar at the bottom right of the map indicates 0 to 80 miles.

Overview of Fish-Hg Model Model Details

Overview of the National Descriptive Model

Environmental scientists and fisheries managers face many challenges. Mercury (Hg) is dispersed in the environment and to the consumption of fish. However, important spatial and temporal trends are often obscured by natural variations between different fish species and sample types. It is often difficult to collect enough samples of each fish species to achieve accurate estimates of mercury concentration. This is especially true for expensive sampling methods.

A statistical model has been developed which promises to overcome these challenges. The model improves analysis by distinguishing trends by factoring out the effects of variation between different species, sizes, and sample types. Modeled data can be normalized to a large number of species, length, and sample cuts. In this way, data from a single sample can be used to estimate mercury concentration for fish with very different characteristics, dramatically lowering sampling costs without decreasing accuracy.

By a different from In this length

2) Model on Species Commonality Between Sites

Done

A Statistical Model and National Data Set for Partitioning Fish Tissue Mercury Concentration Variation between Spatiotemporal and Sample Characteristic Effects

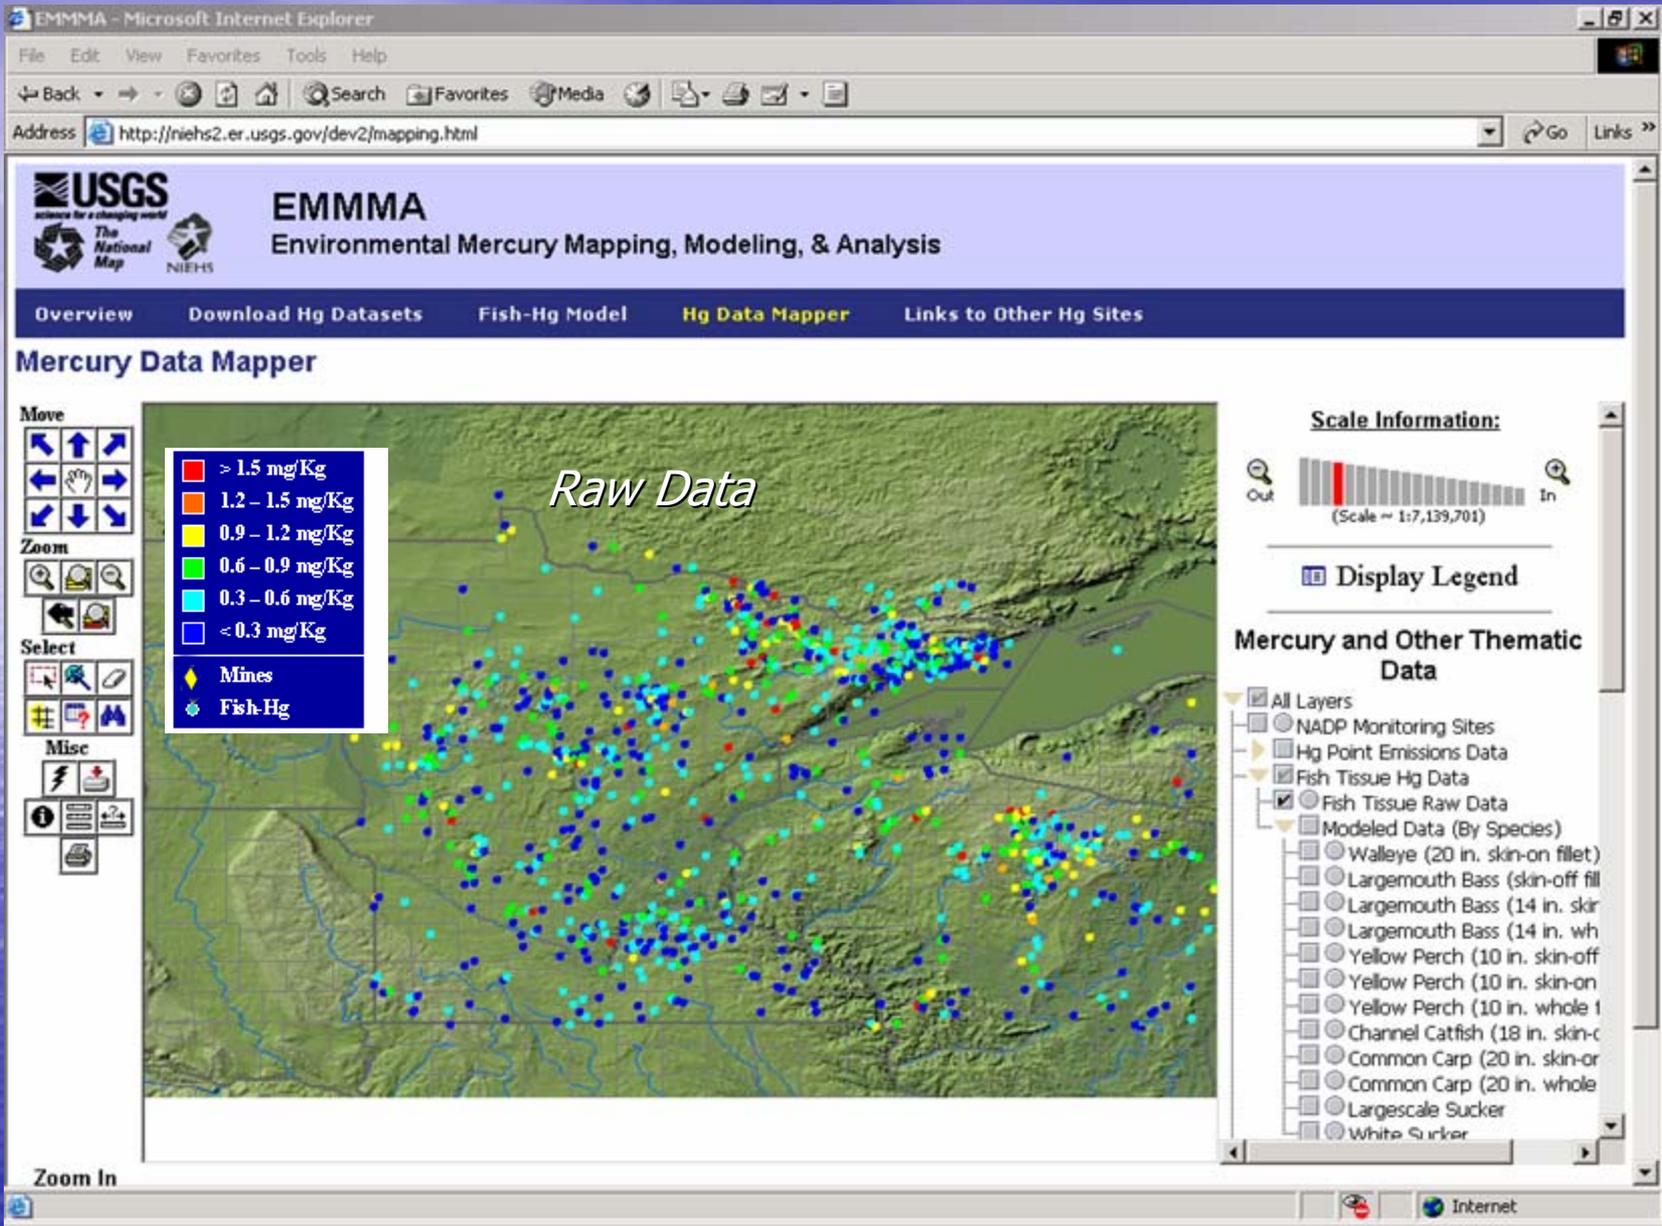

By Stephen P. Wentz

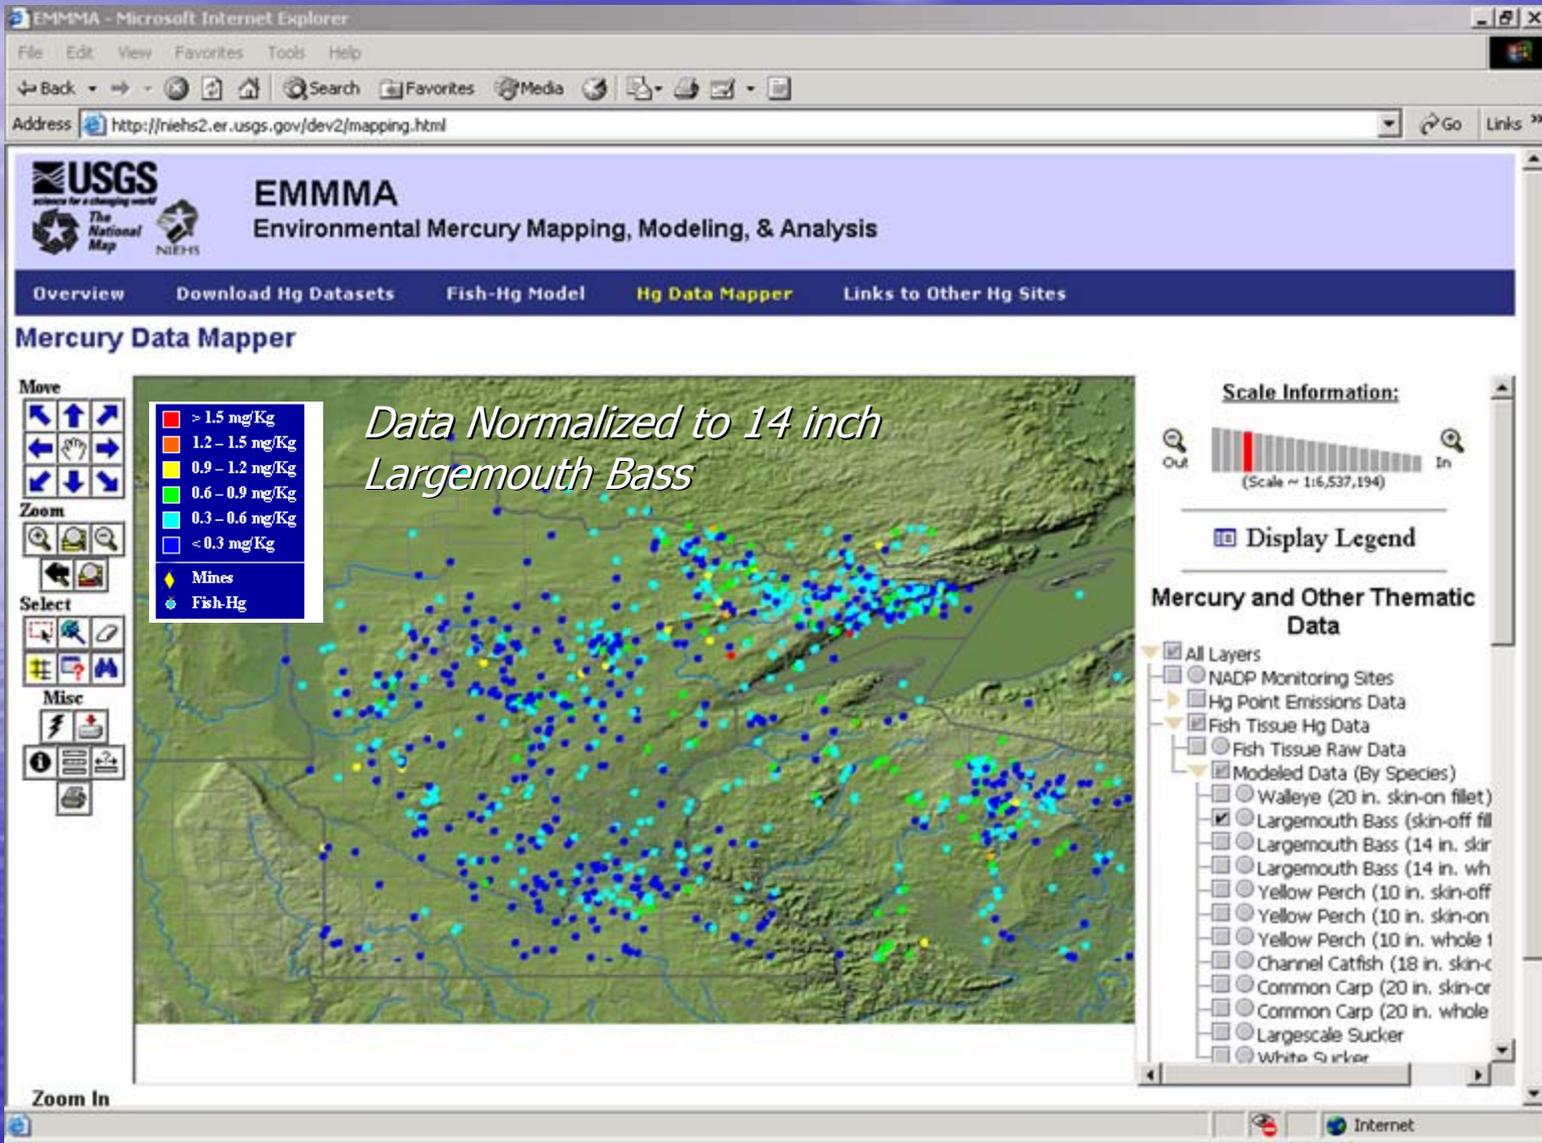

In final review –

Publication date - early September 04

ABSTRACT

Many Federal, State, local and tribal agencies monitor mercury in fish-tissue samples to identify sites with elevated fish tissue mercury (fish-mercury) concentrations, track changes in fish-mercury concentrations over time and produce fish consumption advisories. Interpretation of such monitoring data is often impeded by difficulties in reliably separating the effects of sample characteristics (species, tissues sampled, and length of fish) from the effects of spatial and temporal trends on fish-mercury concentrations. Without such a reliable separation, variation in fish-mercury concentrations due to differences in the characteristics of samples collected over time or across space can be misattributed to temporal or spatial trends; and/or actual trends in fish-mercury concentration can be misattributed to differences in sample characteristics. This report describes a statistical model and national data set (31,813 observations) that produces a relatively reliable separation of spatiotemporal and sample characteristic effects in fish-mercury concentrations. Therefore, this model should be suitable for measuring spatial and temporal trends in fish-mercury concentrations and developing fish consumption advisories. The observed fish-mercury concentration data and model predictions can be accessed, displayed geospatially, and downloaded via the World Wide Web (<http://emmma.usgs.gov>). This report and the associated website may assist in the interpretation of large amounts of data from widespread fish-mercury monitoring efforts.

Demonstration of the National Descriptive Model for Mercury in Fish Tissue

IMPORTANT:
 This is a partially functioning prototype of the Fish-Hg Model. Mapping is functional, however, the **graphing functionality is simulated**. Various functioning simulation scenarios have been hard-coded.
All simulated functionality is indicated in red below. Choose only these options when using this page.

Chart of Observed Fish-Tissue Mercury Concentrations

This is the chart of predicted fish-tissue mercury concentrations based on your selections.

Sampling Location and Date

ID Number	Station	State	Latitude	Longitude	Estimate Parameter
4084	NCBP44	WA	46.35323611	-119.9887083	1.60333871430956

Species and Cut Data for This Graph

ID Number	Common Name	Genus	Species	Sample Type	Estimate Parameter
30	Black Crappie	Pomoxis	nigromaculatus	Whole	1.617594281
90	Common Carp	Cyprinus	carpio	Whole	1.278997999
156	Largescale Sucker	Catostomus	macrocheilus	Whole	1.248342199
181	Northern Squawfish	Ptychocheilus	oregonensis	Whole	1.681854917
257	Smallmouth Bass	Micropterus	dolomieu	Whole	1.650414721
322	White Crappie	Pomoxis	annularis	Whole	1.535672455

Future Directions & Applications

- Refine website to allow user input of data, dynamic recalibration of model
- Improve national data coverage; create fish-Hg exposure surface
- Identify high fish-Hg events, link to causes
- Extend site/models to marine fish, lipophilic PBTs, etc.
- Explore spatial & temporal correlation of Hg surfaces with disease

***Volunteers needed
to Beta-test EMMMA website***
